Averages

- **Simple Average** :
- An average of a set of values is the sum of values divided by the total number of values.
- Average of 'n' values = (Sum of the 'n' values)/n
- This is also called as Arithmetic Mean.
- Average (A) = Sum (S)/ Number(n)
- S = A x n
- **Weighted Average** :
- When all values whose average we want to find do not have uniform occurrences we calculate the weighted average.
- If values y1, y2, y3…occur w1, w2, w3… times then
- Weighted Avg =(w1y1+w2y2+w3y3+ ..)
                         (w1+w2+w3..)

Q. In a class of 50 students, 24 secured 60 in Physics, 16 secured 70 marks and the rest secured 80. What is the average score for Physics in the class?

A. 64.8   B. 65.4   C. 67.2   D. 66.7

Soln :-

Students   24   16   10.

Marks   60   70   80

Average $= \dfrac{24 \times 60 + 16 \times 70 + 10 \times 80}{24 + 16 + 10}$

$= 3360/50$

$= 67.2$

- B. 5,6,7,8   → Avg =6.5

- C. 1,3,5,7,9   → Avg =5

Q. The average age of a class of 22 students is 21 years. The average increased by 1 when the teacher's age also included. What is the age of the teacher?

A. 48   B. 45   C. 43   D. 44

Ans: D

Averages

Q. The average age of a class of 22 students is 21 years. The average increased by 1 when the teacher's age also included. What is the age of the teacher?

Solution 1:-

- Before teacher , total age of students = 22x21

- After teacher is added,

Total age of all students + Age of the teacher =23×22

- Age of the teacher =23×22−22×21

$$=22(23-21)$$

$$=22×2$$

$$=44 \text{ years}$$

Averages

- The average age of a class of 22 students is 21 years. The average increased by 1 when the teacher's age also included. What is the age of the teacher?

- **Solution 2:-**

- New value = old avg + (n $\overset{+}{\underset{-}{}}$ 1)(diff)

+ if member added
- If member removed

- Where, n = total no. of students

difference = |Old avg − new avg|

- New value = 21 + (22+1)(1)

  = 21 + 23

  = 44 years

Averages

Q. There are 50 students in a class. Their average weight is 45 kg. When one student leaves the class the average weight reduces by 100 g. What is the weight of the student who left the class ?

A. 45 kg.   B. 47.9 kg.   C. 49.9 kg.   D. 50.1 kg.

Soln:

New value = old avg + (n $\overset{+}{\underset{-}{}}$ 1)(diff)

$$= 45 + (50 - 1)(0.1)$$ (as we convert 100g into kg $= \frac{100}{1000} = 0.1$ kg)

$$= 45 + 49(0.1)$$

$$= 45 + 4.9$$

$$= 49.9 \text{ kg}$$

Q. There are 50 students in a class. Their average weight is 45 kg. When one student leaves the class the average weight reduces by 100 g. What is the weight of the student who left the class ?

A. 45 kg.　　　　　　　B. 47.9 kg.　　　　　　C. 49.9 kg.　　　　　　D. 50.1 kg.

Soln:

Total weight of 50 students = (45 x 50) kg = 2250 kg

Average weight of 49 students = 45kg -100g = 44.9 kg

So, total weight of 49 students = (44.9 x 49)kg = 2200.1kg

Weight of the students who left the class = 2250 – 2200.1 = 49.9 kg

Q. The average age of 16 men increases by 3 years when a person 27 years old is replaced by another. How old is the new person?

A. 75   B. 30   C. 48   D. 64

Soln:-

Number of men = 16

Let average age be a

→ Total age of 16 men = 16a (Old total)

New average = a+3

→New total age of 16 men = 16 (a+3) = 16a + 48

New Total – Old Total = 48

→ Age of new man = 27 + 48 = 75

Ans : A

Averages

Q. The average age of 16 men increases by 3 years when a person 27 years old is replaced by another. How old is the new person?

A.75   B. 30   C. 48   D. 64

Soln:-

- Average of 16 men increases by 3 years means,

- total age increases by 16 x 3 =48

- If the age of new person same as replaced person then there would have been no change in average.

- But average age of 16 men increased by 3 years

- So, total age of the person replacing another person = 27 + 48 = 75years

Ans : A

Averages

Q. The average age of 8 men is decreased by 2 years when two of them, whose ages are 22 and 28, are replaced by two new men.. What is the average age of two men?

A. 34years   B. 30years   C. 15years   D. 17years

Soln:

- Average of 8 men reduce by 2 years means total age reduces by 16 if two men leave.

- So, the total age of the new men replacing the old men = 22+28−16=34

- => Average = 34/2 = 17 years.

OR

- Total age decreased= (8 * 2) years = 16 years.

- Sum of ages of two new men = (22 + 28 - 16) years = 34 years

- Average age of two new men = (34/2) years = 17 years.

- **Ans: D**

Averages

Q. The average age of students is 7 years and average age of 10 teachers is 50 years. If average age of group of all teachers and students is 8 years. Find the number of students?

A. 420   B. 250   C. 300   D. 270

Soln:

We know, Total = avg x n

	S	T
No.	z	10
Avg	7	50

(student + teacher)x avg   = (student) x avg + (teacher) x avg

(z +10) x 8   = (z   )   x 7 + (10)   x 50

8z+80 = 7z + 500

A. 12 years   B. 10 years   C. 20 years   D. 25 years

Soln:

Present age = x

As given,

Future age = x +15

Old age = x-5   5 times is that n times

3 years hence means (+) as its future ratio given and so its fraction

$$\frac{5x+3}{4x+3} = \frac{11}{9}$$

45x+27 = 44x + 33

Soln:

	M	D
Present	38	x
At birth time	38-x	0

  M   D

38-x = x

38   = 2x

A. 5 years   B. 12 years   C. 10 years   D. None of these

- **Soln**:
- So, we need to first find x here
- A = 2 + B
- B = 2C
- C = x
- So B becomes, B =2x
- So A becomes,
- A = 2 + B
- A = 2 + 2x
- **Ans: C**

Given, the total age = A +B + C =27

- Let the condition occur after y years.
- After y years
- Man's age = (40+y)
- Son's ages (6+y), (3+y), (1+y)
- Sum of sons' ages = (10+3y)

Q. Divide Rs. 18200 amongst 3 persons such that A gets 5/9th of what B & C together get & B gets 6/7th of what A & C together get. What does C get?

A. Rs. 6500   B. Rs. 3300   C. Rs. 8400   D. Rs. 1400

Soln:

A : (B+C)

5 : 9

A+B+C = 5x+9x =14x

14x = 18200 → x =1300 → A = 5x = 6500

B : (C+A)

6 : 7

A+B+C = 6y + 7y =13y

13y =18200 → y = 1400 → B = 6y = 8400

C= 18200-8400-6500 = 3300

Percentage

- Percentage is a fraction whose denominator is 100(per 100)

Fraction x100	% ÷100	Fraction	%		Fraction	%	Fraction	%	Fraction	%
3/4	75%	5/4	125%		1/1	100%	1/6	16.66%	1/11	9.09%
4/5	80%	3/2	150%		1/2	50%	1/7	14.28%	1/12	8.33%
2/3	66.66%	1/16	6.25%		1/3	33.33%	1/8	12.5%	1/13	7.69%
5/6	83.33%				1/4	25%	1/9	11.11%	1/14	7.14%
6/5	120%				1/5	20%	1/10	10%	1/15	6.66%

Percentage

Q. x is 83.33% of y. So y is _____% of x

Solution:

x = 83.33y

$x = \dfrac{5}{6}\, y$

So, $y = \dfrac{6}{5}\, x$

y = 120% (from chart)

Fraction x100	% 100	Fraction	%
3/4	75%	5/4	125%
4/5	80%	3/2	150%
2/3	66.66%	1/16	6.25%
5/6	83.33%		
6/5	120%		

Percentage

Q. x is 80% of y. So y is _____% of x

Solution:

x = 80y

$x = \dfrac{4}{5} y$

So, $y = \dfrac{5}{4} x$

y = 125%

Percentage

Q. A number x is increased by 20% then the number is decreased by 20%. Find the net % change.

- **Soln** :

- If a number is increased / decreased by x% then there is always a loss of $-(x/10)^2$

- Net % Change = $-(20/10)^2$ = -(400/100) = - 4% (loss)

- **OR**

- Let the number be 100

- 100 ↑ by 20% =120

- So 20% ↓ of 120 = 96

- 100   120   96

        -4% = net change

Percentage

Q. A number x is increased by 50% then the number is increased by 20% and again by 10%. Find the net % change

Soln:

- Let the number be 100

- 100 ↑ by 50% =150

- Again, 150 ↑ by 20% =30, So 150 + 30 = 180

- 10% ↑ of 180 = 18, So, 180 + 18 = 198

- 100   150   180   198

      98% = net change

Percentage

- **Two Step change of Percentage**

  In first step if number is changed by a% and the result is again changed by b% the net percentage change of original number is given by

  Net % Change in Number = a + b + ab/100   (+ve or –ve)

Percentage

Q. If a number is increased by 12 % & then decreased by 18% then the net % change in number is

Soln:

Net % Change in Number = a + b + ab/100   (+ve or –ve)

% Change = 12 – 18 + (12 x -18)/100

               = -6 – 2.16

               = - 8.16%

Percentage

- Expenditure = Price x Consumption

- $P \propto \dfrac{1}{\text{Consumption}}$

- So, for expenditure to remain constant, when one quantity increases the other quantity should decrease proportionally.

- Eg: If the price of a commodity is decreased by 20% and its consumption is increased by 20%, what will be the increase or decrease in expenditure on the commodity?

- Soln:

Net % Change = a + b + ab/100 (+ve or –ve)

    % Change = -20 + 20 + (-20 x 20)/100

                    = 0 -4 = -4%

OR

100 === 20%↓(Decrease in Price) ===> 80 === 20%↑(Increase in Consumption) ===> 96.
   Thus, there is a decrement of 4%

Q. Two numbers are respectively 40% and 60% more than a third number. The ratio of the two numbers is:

A. 7:8   B. 3 : 5   C. 4 : 5   D. 6 : 7

Soln:-

- Let the third number be 100

- First number = 40% more than 100 = 100 + 40%of 100 = 100+40 = 140

- Second number = 60% more than 100 = 100 + 60%of 100 = 100 + 60 = 160

- Ratio = $\dfrac{\text{first number}}{\text{second number}}$ = $\dfrac{140}{160}$ = $\dfrac{7}{8}$ = 7 : 8

Q. Two numbers are respectively 40% and 60% more than a third number. The ratio of the two numbers is:

A. 7:8   B. 3 : 5   C. 4 : 5   D. 6 : 7

Soln:-

- Let the third number be x.

- First number = 40% more than x = x + 40%of x = x + $\frac{40}{100}$ x = $\frac{100x+40x}{100}$ = $\frac{140x}{100}$

- Second number = 60% more than x = x + 60%of x = x + $\frac{60}{100}$ x = $\frac{100x+60x}{100}$ = $\frac{160x}{100}$

- Ratio = $\frac{\text{first number}}{\text{second number}}$ = $\frac{\frac{7x}{5}}{\frac{8x}{5}}$ = $\frac{7}{8}$ = 7 : 8

Q. If the radius of a circle is decreased by 50%, find the percentage decrease in its area.

- A. 55%   B. 65%   C. 75%   D. 85%

- **Soln**:

- Area of a circle = πr^2 where r is the radius
  => Area is directly proportional to r^2

- Assume the old radius is = r1=100

- $A_1 = \pi \times 100^2 = 10000\pi$

  Assume the new radius is = r2=50

  $A_2 = \pi \times 50^2 = 2500\pi$

  Decrease in area = $10000\pi - 2500\pi = 7500\pi$

  Percentage decrease in area = $\frac{difference}{old}$ x100 = $\frac{7500\pi}{10000\pi}$ x 100   = 75%
